

- We can now add CSS properties for images between the { and } curly brackets.
- For example, add this code between the curly brackets to set the width of the image:
- width: 100px;
- You'll see that the size of the image changes, so that its width is 100 pixels.

```
img {  
    width: 100px  
}
```

- You can also add a border around the image with this code:

```
img {  
  width: 100px  
  border: 1px solid black  
}
```

- Have you noticed that there's not much space between the image and the border?
