- At the moment, there aren't any CSS properties for your <img> tag, so let's add some!

- Firstly, add the following code underneath the CSS for your div:

```css
div {
    text-align: center;
    overflow: hidden;
    border: 4px dotted red;
    width: 300px;
    background: yellow;
}

img {

}
```

- We can now add CSS properties for images between the { and }curly brackets.

- For example, add this code between the curly brackets to set the width of the image:

- width: 100px;

- You'll see that the size of the image changes, so that its width is 100 pixels.

```
img {
  width: 100px
}
```
